Holmberg's Generalisation: V°-Topicalisation vs. Remnant VP-Topicalisation

1.1 Holmberg's (1997, 1999) V°-Topicalisation approach
As mentioned in our first talk, although OS cannot cross an intervening main verb, (1), OS is possible in clauses with a non-finite main verb if the verb occurs in clause-initial position, (2). In fact, OS has to take place in this case, (3).

(1) Da a. Jeg har ikke kyset hende.  
I have not kissed her  

b. *Jeg har hende ikke kyset ____.

(2) Sw a. Kysst har jag henne inte ____ (bara hållit henne i handen).  
kissed have I her not only held her by hand-the  
(Holmberg 1997: 205)  

Da b. Kyssset har jeg hende ikke ____ (bare holdt hende i hånden).  
kissed have I her not only held her in hand.the  
(Vikner 2005: 407)  

Ic c. Kysst hef ég hana ekki ____ (bara haldið í höndina á henni).  
kissed have I her not only held in hand.the on her  
(Vikner 2005: 431)  

(3) Sw a. *Kysst har jag inte ____ henne.  
kissed have I not her  
(Erteschik-Shir 2001: 59)  

Da b. *Kyssset har jeg ikke ____ hende.  
kissed have I not her  

Holmberg (1997, 1999) observes that although OS of an infinitival clause subject is possible as long as there is no intervening non-adverbial material, (4)a, movement across the non-finite main verb cannot be rescued by subsequent topicalisation of the verb, (4)d.

(4) Sw a. Jag såg henne inte [IP _____ arbeta].  
I saw her not [IP work]  

b. Jag har inte sett [IP henne arbeta].  
I have not seen her work  

c. *Jag har henne inte sett [IP _____ arbeta].  

d. *Sett _____ arbeta har jag henne inte ____________________  

(Holmberg 1997: 206)
Holmberg (1997, 1999) concludes that HG is a matter of derivation, not representation: A violation of HG as in (4)c cannot be repaired by subsequent operations as in (4)d that place the blocking element to the left of the shifted object; in other words, HG may not be violated at any point in the course of derivation. Consequently, the grammatical sentences in (1) cannot involve OS prior to remnant VP-topicalisation since that would violate HG, cf. (5). Rather, they must be derived by Vº-topicalisation, with subsequent OS, cf. (6).¹

Sw a. \([\text{CP har [IP jag inte [VP2 kysst henne]]]}\]

b. \([\text{CP har [IP jag henne [VP1 inte [VP2 kysst ____]]]}]\)

   \[\text{violation of HG!!!}\]

   x x x

c. \([\text{CP [VP2 Kysst ____] har [IP jag henne [VP1 inte _______________]]]}\)

Sw a. \([\text{CP har [IP jag inte [VP2 kysst henne]]]}\]

b. \([\text{CP [Vº Kysst] har [IP jag [VP1 inte [VP2 ____ henne]]]}]\)

c. \([\text{CP [Vº Kysst] har [IP jag henne [VP1 inte [VP2 ____ ____]]]}]\)

However, if Vº-topicalisation would be possible, we would expect the sentences in (7)b/(8)b to be acceptable, contrary to fact.

(7) Da a. Jeg har ikke smidt den ud.  
   I have not thrown it out

   b. *Smiðt har jeg den ikke ____ ____ ud.

¹ Note that OS in the Vº-topicalisation analysis is countercyclical: It targets a lower position than the previous movement of Vº, violating Chomsky's (1993) Extension Principle (unless OS is adjunction and the Extension Condition is restricted to specifier positions / substitution).

Moreover, the Vº-topicalisation analysis involves movement of an Xº to an XP-position.

Vikner & Engels: Object Shift, Remnant VP-Topicalisation, and Optimality Theory, p. 3
Against Holmberg (1997, 1999), we would like to suggest that remnant VP-topicalisation is possible, though it is subject to certain restrictions.

1.2 Fox & Pesetsky’s (2005) remnant VP-Topicalisation approach

As Fox & Pesetsky (2005) mentions, remnant VP-topicalisation is possible in Swedish under certain conditions: In double object constructions, topicalisation of a non-finite main verb may take along the IO, stranding the DO in shifted position, (9)a. By contrast, stranding of an IO pronoun alone is not possible, (9)b.

(9) Sw a. ?[VP Gett henne ___] har jag den inte.
    given her have I it not

Fox & Pesetsky (2005) suggests that the mapping between syntax and phonology, i.e. Spell-out, takes place at various points in the course of derivation (including at VP and at CP), whereby the material in the Spell-out domain D is linearized; see also Chomsky (2000, 2001). The crucial property of Spell-out is that it may only add information about the linearization of a newly constructed Spell-out domain D’ to the information cumulatively produced by previous applications of Spell-out. Established information cannot be deleted in the course of derivation. Consequently, HG derives from ordering contradictions. OS cannot take place if it results in ordering statements at CP that contradict those established at Spell-out of VP. Correspondingly, the asymmetry between stranding of an IO and stranding of a DO by remnant VP-topicalisation illustrated in (9) above is expected by order preservation. Stranding of an IO, but not stranding of a DO gives rise to contradictory ordering statements at the various Spell-out domains: At VP, "IO<DO" is established, which is maintained at the Spell-out of CP in (9)a but not in (9)b.

Note that Fox & Pesetsky (2005) predicts that movement operations that do not obey HG have to proceed successive cyclically: The underlined constituents in (10) have to move through the edge of VP prior to linearisation of the VP domain to prevent ordering contradictions at the Spell-out of CP. These movement operations comprise various instances of A-movement and A-bar-movement operations, such as Scandinavian Negative Shift (see Christensen 2005), wh-movement, topicalisation, and subject raising.
(10) Da a. Måske har han ingen bøger læst _______.
   probably has he no books read
b. Hvad har du læst _______?
   what have you read
c. Bøgerne har jeg læst _______.
   books-the have I read
d. Måske blev bøgerne læst _______.
   perhaps were books-the read

Hence, the crucial difference between the various movement operations in (10) and OS is that the former may - and indeed must – go through the edge of VP, but as Fox & Pesetsky (2003) states, in their analysis OS cannot involve movement through the edge of VP.

2 An OT approach to Object Shift and remnant VP-Topicalisation

2.1 Asymmetry I: Stranding of a DO vs. Stranding of an IO

As shown in our first talk, the ranking OrdPres >> ShiftPron captures the fact that OS is blocked by an intervening non-adverbial element, predicting that OS is dependent on movement of the main verb. However for OS to be possible, the main verb does not necessarily have to undergo V°-to-I°(-to-C°) movement. What is crucial is that the main verb moves to a position in front of the target position of OS, such that their relative order is preserved. This can also be achieved by placing a non-finite verb in topic position as in (2); cf. Tableau 1.

Tableau 1: OS with remnant VP-topicalisation

<table>
<thead>
<tr>
<th>Da</th>
<th>OrdPres</th>
<th>ShiftPron</th>
<th>Stay</th>
<th>ex.</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>V Aux Sub Adv Pron-Obj</td>
<td>*!</td>
<td></td>
<td>(3)</td>
</tr>
<tr>
<td>a'</td>
<td>V Aux Sub Pron-Obj Adv</td>
<td>*</td>
<td></td>
<td>(2)</td>
</tr>
</tbody>
</table>

(Only Stay-violations induced by OS are listed.)

We propose that in this case the pronominal object undergoes OS prior to remnant VP-topicalisation. In Holmberg’s (1997, 1999) approach such remnant VP-topicalisation is ruled out by the assumption that HG is derivational, i.e. that it cannot be violated at any point in the derivation, compare (5) above. The OT constraint OrdPres, by contrast, is representational: Constraint violations are computed based on the final structure of the candidates. Hence, although the individual steps of OS might violate OrdPres, this is of no consequence as long as the verb is subsequently placed in front of the shifted object such that their precedence relation is re-established.
The asymmetry between stranding of an IO and stranding of a DO in (9), repeated in (11), can be captured by the ranking \( \text{ORD}_PRES >> \text{SHIFT}_PRON \).

(11) Sw a. \( *[VP \text{ Gett } \underline{\text{henne } \underline{\text{den}}}] \text{ har } \underline{\text{jag den}} \text{ inte.} \)

\hspace{1cm} \text{given} \hspace{1cm} \text{her} \hspace{1cm} \text{have} \hspace{1cm} \underline{\text{I}} \hspace{1cm} \underline{\text{it}} \hspace{1cm} \underline{\text{not}}

b. \( *[VP \text{ Gett } \underline{\text{den}}] \text{ har } \underline{\text{jag henne}} \text{ inte.} \) (Fox & Pesetsky 2005: 25)

Note that also both objects of a double object construction may be taken along, (12)a, or both of them may be stranded by remnant VP-topicalisation, (12)b.

(12) Da a. \( *[VP \text{ Givet } \underline{\text{hende } \underline{\text{den}}} \text{ har } \underline{\text{jeg}} \text{ ikke.} \)

\hspace{1cm} \text{given} \hspace{1cm} \text{her} \hspace{1cm} \text{it} \hspace{1cm} \text{have} \hspace{1cm} \underline{\text{I}} \hspace{1cm} \underline{\text{not}}

b. \( *[VP \text{ Givet } \underline{\text{den}}] \text{ har } \underline{\text{jeg hende}} \underline{\text{den}} \text{ ikke.} \)

Because of these alternatives, it is necessary to assume that it is specified in the input which constituents are to be placed in topic position (= bold in the tableaux below). Stranding of an element that should appear in topic position then violates \text{TOPIC} whereas taking along too much material does not violate this constraint, see Tableau 2 and Tableau 3.

(13) \text{TOPIC:} \text{ Elements with a } [+\text{topic}] \text{ feature occur in Spec,CP.}

</table>
As Tableau 2 and Tableau 3 show, \textsc{shiftpron} favours stranding of a pronoun which is, however, only possible if the pronoun is not marked [+topic]. The asymmetry between stranding of a DO and stranding of an IO is expected by the ranking \textsc{ordpres} >> \textsc{shiftpron}. OS of a DO maintains the ordering relations in remnant VP-topicalisations, satisfying \textsc{ordpres} (see Tableau 4). Note that it is crucial for the remnant VP-topicalisation constructions that \textsc{ordpres} refers to precedence rather than c-command relations: While the precedence relations are maintained in (11)a, the c-command relations are not - neither the verb nor the IO c-commands the shifted DO. In contrast, remnant VP-topicalisation does not re-establish the base order relations if the IO is stranded. Consequently, the violation of \textsc{ordpres} rules out stranding of the IO in OS position, compare Tableau 5 below. Instead, the IO has to be taken along by VP-topicalisation, giving rise to neutralization: Despite the different input specifications with regard to topichood, the same candidate (namely, candidate a) arises as output in Tableau 2 and Tableau 5. (But stranding of the IO is possible if it does not result in a violation of \textsc{ordpres}, namely if both objects are stranded as in (12)b.)

\begin{table}[h]
\centering
\begin{tabular}{|c|c|c|c|c|}

\end{tabular}
\caption{No remnant VP-topicalisation that strands IO}
\end{table}

Similarly, the unacceptable sentence in (4)d, repeated here as (14)c, is ruled out by the ranking \textsc{ordpres} >> \textsc{shiftpron}. These data led Holmberg (1997, 1999) to assume that remnant VP-topicalisation is not possible.

\textit{Vikner & Engels: Object Shift, Remnant VP-Topicalisation, and Optimality Theory, p. 7}
Moreover, the analysis predicts that stranding of the object is unacceptable in constructions in which the object is followed by other elements within VP, e.g. in constructions with a particle verb or a verb with an additional PP-complement, see (15)b/(16)b. In contrast, topicalisation of the full VP as in (15)a/(16)a is possible.

Although they occupy a right-peripheral position within VP, particles and PPs cannot be left behind (irrespective of whether or not the object is taken along by VP-topicalisation or stranded as well). This is expected under the analysis proposed here: Only elements whose movement out of VP may be triggered by a constraint dominating STAY can be stranded by remnant VP-topicalisation.
From the discussion in the previous sections, we might expect that all that matters is that the remnant object is at the edge of the the VP right before this VP is topicalised. However, not all objects on the right edge may be left behind during VP-topicalisation: The object of an infinitival clause cannot be stranded by remnant topicalisation of the main clause VP although it is the rightmost element within that VP.

\[(19)\]
\[
\begin{align*}
\text{Da a. } & \quad \text{[VP Set [IP ham [VP fotografere hende]]]} & \quad \text{har jeg ikke.} \\
\text{b. } & \quad *\text{[VP Set [IP ham [VP fotografere ____]]]} & \quad \text{har jeg hende ikke.}
\end{align*}
\]

Thus, besides the linear restriction, there would seem to also be a structural restriction, ruling out the leaving behind of an object which is too deeply embedded.

Also the object of a Swedish particle verb cannot be left behind during remnant VP-topicalisation even though the particle precedes the object in Swedish and therefore stranding of the object would not violate \textsc{OrdPres}.

\[(20)\]
\[
\begin{align*}
\text{Sw a. } & \quad \text{[VP Kastat bort den]} & \quad \text{har jag inte.} \\
\text{b. } & \quad *\text{[VP Kastat bort ____]} & \quad \text{har jag den inte.} \quad \text{(Gunlög Josefsson, p.c.)}
\end{align*}
\]

However, OS is possible in particle verb constructions where the particle is topicalised and the verb undergoes V2, (21):

\[(21)\]
\[
\begin{align*}
\text{Sw a. } & \quad \text{UT kastade dom mej inte ____} \quad \text{(bara ned för trappan).} \\
\text{b. } & \quad \text{(Ja, ja, jag ska mata din katt, men) IN släpper jag den inte ____}. \quad \text{(All right, I will feed your cat but)} \quad \text{in let I it not (Holmberg 1997: 209)}
\end{align*}
\]

We would like to suggest that the shifted object can only move out of the VP in (20)b in two steps, first by adjoining to the PrtP and then by adjoining to the VP. (The VP is what undergoes topicalisation to Spec,CP, and although the individual steps of the object shift violate \textsc{OrdPres}, this is of no consequence, as \textsc{OrdPres} violations are only computed on the final structure):
If we furthermore assume that adjunction to the PrtP is only necessary because PrtP and VP here do not have the "same" head, then we have a difference between the above situation and double object constructions like the following (where remnant topicalisation is possible):

(23) Sw $[\text{VP t } \text{gett}]$ = (9)a $\begin{array}{c}
\text{given} \\
\text{her}
\end{array}$

where there is no intermediary trace adjoined to the lower VP. We now would like to suggest that the reason why the absence of the intermediary trace is important is that it is possible to topicalise the (higher) VP in (23) without bringing along any intermediary trace (i.e. what is topicalised is the inner segment of the higher VP). In contrast, even if what is topicalised in (22) is only the inner segment of the VP, an intermediary trace would still have to come along to Spec,CP, viz. the trace adjoined to PrtP. One possible reason why intermediary traces are not allowed to come along to Spec,CP could be that they have to be licensed by being c-commanded by the next higher link in the chain (which does not hold under VP-topicalisation), whereas a trace in its base position (which has to come along to Spec,CP in both (22) and (23)) may be licensed in a different way, e.g. simply by being in a thematic position. The difference between (21) and (20) is now that in (21), only the PrtP is topicalised (the verb is also moved, but by a different movement, V2) and so there does not have to be an intermediary trace inside Spec,CP.

2.2 Asymmetry II: Subject vs. Object

The ranking $\text{ORDPRES >> SHIFTPRON}$ thus predicts that remnant VP-topicalisation may strand an object in shifted position as long as the precedence relations are maintained (and its base position is not too deeply embedded). Consequently, only an object that is right-peripheral in VP may be left behind, giving rise to the asymmetry between stranding of an IO and stranding of a DO.

Note that stranding of an object during remnant VP-topicalisation is also unacceptable if there is an adverbial left-adjoined to the topicalised VP, (i)c. Under the assumption that extraction of the object has to involve its adjunction to the minimal VP, the ungrammaticality of (i)c follows: The topicalised VP includes an intermediary trace.

(i) Da. a. Han har nok $[\text{VP omhyggeligt [VP læst den]}]$ men har han forstået den?
   $he\; has\; probably\; carefully\; read\; it\; but\; has\; he\; understood\; it?$
   b. ?$[\text{omhyggeligt [VP læst den]}]$ har han nok, ...
   c. *$[\text{omhyggeligt [VP t]}$ $[\text{VP læst ___]}]$ har han den nok, ...

Vikner & Engels: Object Shift, Remnant VP-Topicalisation, and Optimality Theory, p. 10
In addition, there is an asymmetry between stranding of an object and stranding of a subject by remnant VP-topicalisation, indicating that a non-peripheral trace in the topicalised VP is not a problem as such. The base order of elements does not have to be maintained by remnant VP-topicalisation if the remnant occurs in subject position (as in passives), see (24)a/(25)a vs. (24)b/(25)b.

(24) Da a. *[VP Smidt ___ ud] har jeg den ikke.
thrown out have I it not
b. [VP Smidt ___ ud] blev den ikke.
thrown out was it not

put on table-the have I it not
b. *[VP Stillet ___ på bordet] blev det ikke.
put on table-the was it not

This contrast is accounted for if the constraint that triggers subject movement to Spec,IP, SUBJECT, outranks ORDRES.3 (Note that the acceptability of subject raising out of a verb particle construction indicates that depth of embedding does not play a role for subject movement either.)

</tbody>
</table>

2.3 Asymmetry III: Remnant VP-Topicalisation out of a Main vs. an Embedded Clause

Moreover, there is an asymmetry between remnant VP-topicalisation out of a main clause and remnant VP-topicalisation out of an embedded clause.

Remember that there is a contrast between main and embedded clauses in finite verb movement in MSc and Icelandic and therefore also in the availability of OS.

---

3 Accordingly, constraints triggering other movement operations such as wh-movement or topicalization that are not subject to HG, (10), outrank OrdPres (e.g. WhSpec, Topic >> OrdPres). The contrast between different movement devices as to whether or not they are subject to HG is thus accounted for by differences in the ranking of their constraints relative to OrdPres.

Vikner & Engels: Object Shift, Remnant VP-Topicalisation, and Optimality Theory, p. 11
A full VP may be topicalised from both main clauses and embedded clauses.

(26) Da a. *Hvorfor e Peter aldrig læste den?
why Peter never read it

b. Hvorfor læste Peter den aldrig ___ ___?

(Vikner 2005: 394)

(27) Da a. Jeg spurgte hvorfor Peter e aldrig læste den.
I asked why Peter never read it

b. *Jeg spurgte hvorfor Peter læste den aldrig ___ ___.

(Vikner 2005: 396)

(28) Ic a. *Af hverju e Pétur aldrei las hana?
why Pétur never read it

b. Af hverju las Pétur hana aldrei ___ ___?

(Vikner 2005: 394)

(29) Ic a. *Ég spurði af hverju Pétur e aldrei læsi hana.
I asked why Pétur never read it

b. Ég spurði af hverju Pétur læsi hana aldrei ___ ___.

(Vikner 2005: 396)

Topicalisation of a remnant VP, by contrast, is only possible out of a main clause, (31)a, not out of an embedded clause in Danish: The stranded object may neither follow the finite auxiliary (in its base position), (31)b, nor may it precede it, (31)c:

(30) Da a. [VP Set ham] har jeg ikke, ...
seen him have I not

... hvis jeg skal være ærlig, men jeg har talt i telefon med ham.
if I should be totally honest but I have spoken in phone with him

b. [VP Set ham] tror jeg ikke at du har, ...
seen him believe I not that you have

... men du kan måske nok have talt i telefon med ham.
but you may perhaps well have spoken in phone with him
This asymmetry shows that stranding must involve OS, because OS requires the (stranded) object to occur in a position to the left of the base position of a finite verb (SHIFTPRON), but it can only do so if this verb has itself left its base position, (ORDPRES).

</tbody>
</table>

The hypothesis that (a) a stranded object has to undergo movement to some position to the left of the finite verb and (b) that this movement is only possible if the finite verb itself has left its base position (i.e. that OS has to take place) seems to be supported by the fact that Icelandic which has Vº-to-Iº movement in embedded clauses marginally permits a remnant object in VP-topicalisation out of an embedded clause (as opposed to the Danish (31)b,c which are completely ungrammatical).
Note that remnant VP-topicalisation from embedded clauses is possible in passives, i.e. if the element left behind occurs in subject position. This follows from SUBJECT being ranked higher than HG, as in Tableau 8 above.

(33) Da a. [VP Set _____] blev han ikke, ...
    seen was he not

b. [VP Set _____] tror jeg ikke at han blev, ...
    seen think I not that he was
    ... men der var nok mange der hørte ham.
    but there were probably many who heard him
3 Conclusion

Holmberg (1997, 1999) considers occurrences of a non-finite verb in topic position such as (2) to result from V°-topicalisation. He assumes that HG is a matter of derivation rather than of representation, i.e. a violation of HG cannot be rescued by some subsequent operation, and hence the non-finite verb has to move before OS can take place, ruling out remnant VP-topicalisations altogether.

However, Fox & Pesetsky (2005) have presented data from double object constructions that clearly show that remnant VP-topicalisation is possible, as long as it does not involve a reversal of the base order of elements, and suggesting that HG is representational. We have collected more data that corroborate Fox & Pesetsky's observation and we agree with them in the assumption that HG is to be accounted for in terms of order preservation. Their approach builds on the assumption that Spell-out applies at various points in the derivation (in particular, at VP and at CP) and that the information about the linearisation of the material of a newly constructed Spell-out domain must not contradict the cumulated information of previous applications of Spell-out. In this way, Fox & Pesetsky (2005) predict that OS differs radically from other types of (A- and A-bar-) movement that can result in a reversal of the order of elements, such as e.g. wh-movement or subject raising, in that the latter have to proceed successive cyclically through the left edge of VP while this is impossible for OS.

In contrast, in our OT approach, order preservation is required by a violable constraint. This means that it is the ranking of the ORDERPRESERVATION constraint relative to the constraints that motivate the various types of movement which accounts for the contrast as to whether or not a certain movement operation has to be order preserving. Hence, OS does not receive a special treatment in our approach; the properties distinguishing it from other movement types result from constraint interaction.

The linear conception of HG as expressed by the constraint ORDRES and its dominance over the constraint that triggers OS, SHIFTPRON, predicts that only pronominal objects that originate in a right-peripheral position within VP might be left behind in OS position during remnant VP-topicalisation, accounting for the asymmetry in stranding of an IO and stranding of a DO observed by Fox & Pesetsky (2005). However, depth of embedding also plays a role for whether or not an object may have undergone OS out of a topicalised VP: The remnant VP in Spec,CP may not include an intermediary trace of a shifted object. Moreover, we presented new data that showed that subject raising does not underly either of these restrictions, and this may be accounted for by a different ranking of SUBJECT and SHIFTPRON relative to the corresponding prohibitions (including ORDRES).

Finally, the asymmetry between main and embedded clauses as to the applicability of remnant VP-topicalisation in MSc illustrates that object stranding has to involve OS. Object stranding is only possible in sentences in which finite verb movement has taken place, something that would be expected if any object left behind during remnant VP-topicalisation would have to undergo OS (and that as always, OS has to respect order preservation).
Appendix: Structure Preservation

There are native speakers of Danish whose intuitions do not agree with the acceptability judgments given above. Rather than to subject remnant VP-topicalisation to a linear restriction, permitting stranding of an object in OS position as long as it does not change the base order of elements (cf. (11) and (12) above), these speakers do not allow for object stranding during remnant VP-topicalisation at all. Topicalisation of a full VP, in contrast, is judged acceptable.

(34)

Da a.  
\[ [\text{VP} \text{ Givet hende den]} \text{ har jeg ikke.} \]

\text{given her it have I not}

b. \*\[ [\text{VP} \text{ Givet } \underline{\underline{\_ \_ \_}} \text{ har jeg hende den ikke.} \]
c. \*\[ [\text{VP} \text{ Givet hende } \underline{\underline{\_ \_ \_}} \text{ har jeg den ikke.} \]
d. \*\[ [\text{VP} \text{ Givet } \underline{\underline{\_ \_ \_}} \text{ den har jeg hende ikke.} \]

The pattern in (34) can be accounted for if in addition to order preservation, a constraint on structure preservation is considered to restrict OS (cf. Déprez 1994, Müller 2001, Sells 2001, and Williams 2003).

(35)

\text{STRUCTURE PRESERVATION (STRUCPRES):}

If the foot of the chain of some non-adverbial element \( \alpha \) c-commands the foot of the chain of some element \( \beta \), the head of the chain of \( \alpha \) also c-commands the head of the chain of \( \beta \).

In other words, where ORDPRES says "preserve the sequence", STRUCPRES says "preserve the c-command relationships".

Like ORDPRES, the constraint STRUCPRES and its dominance over SHIFTPRON predicts that OS cannot cross an intervening non-adverbial element: For example, OS across a verb \textit{in situ} as in (36)b changes the c-command relation between the verb and the shifted object.

(36)

Da a. Jeg spurgte hvorfor Peter aldrig læste \textit{den}.

\text{I asked why Peter never read it}

b. *Jeg spurgte hvorfor Peter \textit{den} aldrig læste \underline{\underline{\_ \_ \_}}.

In contrast to ORDPRES, however, STRUCPRES (\( \gg \) SHIFTPRON) rules out stranding of an object during VP-topicalisation. While the linear relations between the verb and the objects are maintained in (34)b,c above, their structural relations are not: The verb (and IO) in Spec,CP is too deeply embedded to c-command the stranded (IO and) DO. Consequently, STRUCPRES \( \gg \) SHIFTPRON rules out stranding of an object during remnant VP-topicalisation while permitting topicalisation of a full VP.
Hence, variation between speakers as to the strandability of objects during VP-topicalisation may be accounted for by a contrast in the ranking of two very similar constraints, one requiring order preservation, the other structure preservation.
